

# Point Of Care

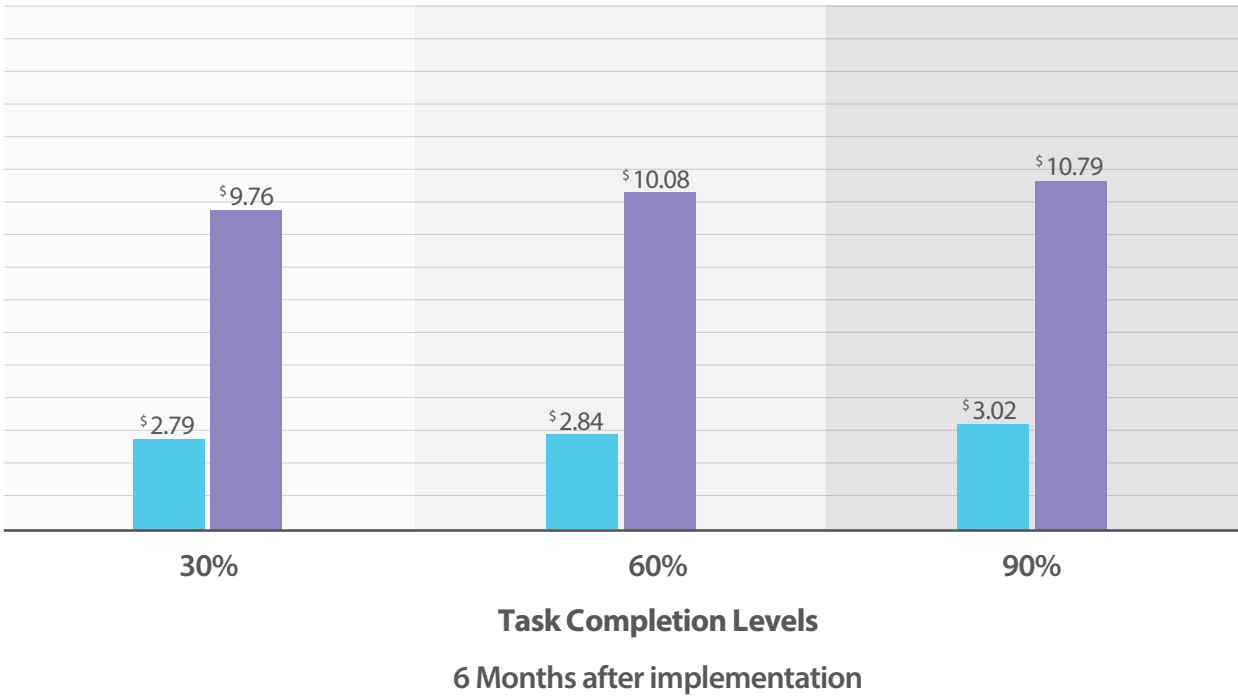

### High level product description:

PointClickCare’s Point of Care (POC) is an easy-to-use solution that enables users to document clinical care activities at or near the point of resident care. Care team members can access POC from kiosks, wall-mounted touch screens, laptop computers, or on the go from a mobile device. Accurate capture of ADLs and full integration with MDS assessments increases RUG scores. Clinical managers gain greater insight into day-to-day activities, monitoring the completion of care and resident status through dashboards and automatically generated alerts, in real-time.

### Hypothesis:

PointClickCare theorized that our customers were financially benefiting by using POC and that Task Completion levels affected the reimbursement levels. To validate our hypothesis, we gathered MDS reimbursement data for all of our customers who implemented POC between December 2001 and January 2016. We then compared their Medicare A and Medicaid reimbursements rates to their task completion levels at the six month mark.

View the results below:

### Conclusion:

**The Medicaid** analysis performed at six months after implementation, demonstrated that ppd reimbursement rates grew as Task Completion rates increased; From an average increase of \$2.79, with 30 % Task Completion, to an average increase of \$3.02 ppd, with 90% Task Completion.

**The Medicare A** analysis performed at six months after implementation, demonstrated that ppd reimbursement rates grew as Task Completion rates increased; From an average increase of \$9.76, with 30 % Task Completion, to an average increase of \$10.79 ppd, with 90% Task Completion.
